The NEW ENGLAND JOURNAL of MEDICINE

Duration of Device-Based Fever Prevention after Cardiac Arrest

N Engl J Med 2023;388:888-97.

＜心停止後脳損傷と低体温＞

- Hypothermia decreases the cerebral metabolic rate for oxygen ($CMRO_2$) by about 6% for each 1℃ reduction in core temperature and this reduces the release of excitatory amino acids and the production of free radicals.

Resuscitation 2015; 95: 202-22.

	no./total no. (%)			
Favorable neurologic outcome‡	54/137 (39)	75/136 (55)	1.40 (1.08–1.81)	0.009
Death	76/138 (55)	56/137 (41)	0.74 (0.58–0.95)	0.02

※ いずれのStudyも ① Control群で多くの発熱を認める。
② 復温後の発熱予防は行っていない。

ILCOR Recommendations

On the basis of the published evidence to date, the Advanced Life Support (ALS) Task Force of the International Liaison Committee on Resuscitation (ILCOR) made the following recommendations in October 2002:

- Unconscious adult patients with spontaneous circulation after out-of-hospital cardiac arrest should be cooled to 32°C to 34°C for 12 to 24 hours when the initial rhythm was ventricular fibrillation (VF).
- Such cooling may also be beneficial for other rhythms or in-hospital cardiac arrest.

Recommendations for fever prevention for 72 hours were introduced in 2005.

European Resuscitation Council Guidelines for Resuscitation 2005
Section 4. Adult advanced life support

Jerry P. Nolan, Charles D. Deakin, Jasmeet Soar, Bernd W. Böttiger, Gary Smith

Resuscitation (2005) **67S1**, S39–S86

- 心停止後48時間以内は高体温(発熱)が起こりやすい。
- 体温37℃を超えると神経学的転帰不良のリスクが増える。
- 動物実験では虚血モデルに対する解熱薬投与や冷却法により梗塞容積が減少した。
- ヒトの観察研究で、臨床的脳死では入院72時間以内の腋窩温は高く、腋窩温が高い患者のほとんどは脳死と診断された。

↓

(だから) 心停止後「72時間」までの高体温は、解熱薬や冷却法により治療すべきである。

European Resuscitation Council and European Society of Intensive Care Medicine Guidelines 2021: Post-resuscitation care☆

RESUSCITATION 161 (2021) 220–269

Temperature control

- We recommend targeted temperature management (TTM) for adults after either OHCA or in-hospital cardiac arrest (IHCA) (with any initial rhythm) who remain unresponsive after ROSC.
- Maintain a target temperature at a constant value between 32 °C and 36 °C for at least 24 h.
- Avoid fever (>37.7 °C) for at least 72 h after ROSC in patients who remain in coma.
- Do not use pre-hospital intravenous cold fluids to initiate hypothermia.

ERC-ESICM guidelines on temperature control after cardiac arrest in adults ☆

RESUSCITATION 172 (2022) 229–236

Table 2 – ERC-ESICM Recommendations for temperature control after cardiac arrest in adults.

We recommend continuous monitoring of core temperature in patients who remain comatose after ROSC from cardiac arrest (good practice statement).
We recommend actively preventing fever (defined as a temperature > 37.7 °C) in post-cardiac arrest patients who remain comatose (weak recommendation, low-certainty evidence).
We recommend actively preventing fever for at least 72 hours in post-cardiac arrest patients who remain comatose (good practice statement).
Temperature control can be achieved by exposing the patient, using anti-pyretic drugs, or if this is insufficient, by using a cooling device with a target temperature of 37.5 °C (good practice statement).
There is currently insufficient evidence to recommend for or against temperature control at 32–36 °C in sub-populations of cardiac arrest patients or using early cooling, and future research may help elucidate this. We recommend not actively rewarming comatose patients with mild hypothermia after ROSC to achieve normothermia (good practice statement).
We recommend not using prehospital cooling with rapid infusion of large volumes of cold IV fluid immediately after ROSC (strong recommendation; moderate certainty evidence).

L008-2

「低体温療法」は「体温維持療法」に変わります

「L008-2 低体温療法」は「**L008-2 体温維持療法**」に名称を変え、
算定条件の目標温度が 35℃以下から **36℃**以下に、
維持時間が 12 時間以上から **24 時間**以上に変更となりました。

診療報酬改定について

改定前

L008-2

低体温療法（1 日につき）

12,200 点

(1) 低体温療法は、心肺蘇生後の患者に対し、直腸温 **35℃**以下で **12 時間**以上維持した場合に、開始日から3日間に限り算定する。

(2) 重度脳障害患者への治療的低体温の場合は算定できない。

(3) 当該点数を算定するに当たり、必ずしも手術を伴う必要はない。

2022 年 4 月　改定後

L008-2

体温維持療法（1 日につき）

12,200 点

(1) **体温維持療法**は、心肺蘇生後の患者に対し、直腸温 **36℃**以下で **24 時間**以上維持した場合に、開始日から3日間に限り算定する。

(2) 重度脳障害患者への治療的低体温の場合は算定できない。

(3) 当該点数を算定するに当たり、必ずしも手術を伴う必要はない。

ランダム化90日以内での

- 全死亡　　または
- Cerebral Performance Category (CPC) = 3 or 4

成人用脳機能カテゴリースケール（Cerebral Performance Category Scale［Adult］）*

スコア	カテゴリー	説明
1	正常（脳機能良好）	意識清明で，労働が可能であり，普通の生活を送ることができる。 軽度の心理的問題または神経脱落症状を有することがある（例，軽度の嚥下困難，機能障害を伴わない不全片麻痺，軽微な脳神経の異常）。
2	中等度障害（身体障害はあるが介助は要さない）	意識があり，保護された環境でのパートタイム勤務または介助なしで日常生活動作（例，着衣，公共交通機関での移動，食事の準備）を行うのに十分な脳機能を有する。 片麻痺，痙攣発作，運動失調，構音障害，失語，または永続的な記憶障害もしくは精神状態の変化がみられることがある。
3	高度障害（意識はあるが身体障害があり介助を要する）	意識はあるが，日常生活に他者の介助を必要とする（施設内または自宅の場合には家族の並外れた努力の下で）。少なくとも制限された認知能力がある。 このカテゴリーには，広範囲の神経機能障害が含まれ，歩行可能であるが重度の記憶障害または認知症があり介助なしの生活ができない患者から，麻痺があり眼でしか意思疎通ができない患者（閉じ込め症候群でみられるような状態）に至るまで，幅がある。
4	意識がない（昏睡または植物状態）	意識がなく，周囲の状況を認識できず，認知能力がない。周囲環境との言語的または心理的な相互作用がない。
5	脳死	脳死の基準を満たしているか，従来の基準に基づき死亡している状態

*分類の際は，どの基準においても最も悪い値を用いる。神経疾患が原因の場合についてのみ，障害をスコア化する。評価は診療録または保護者との面接に基づいて行う。

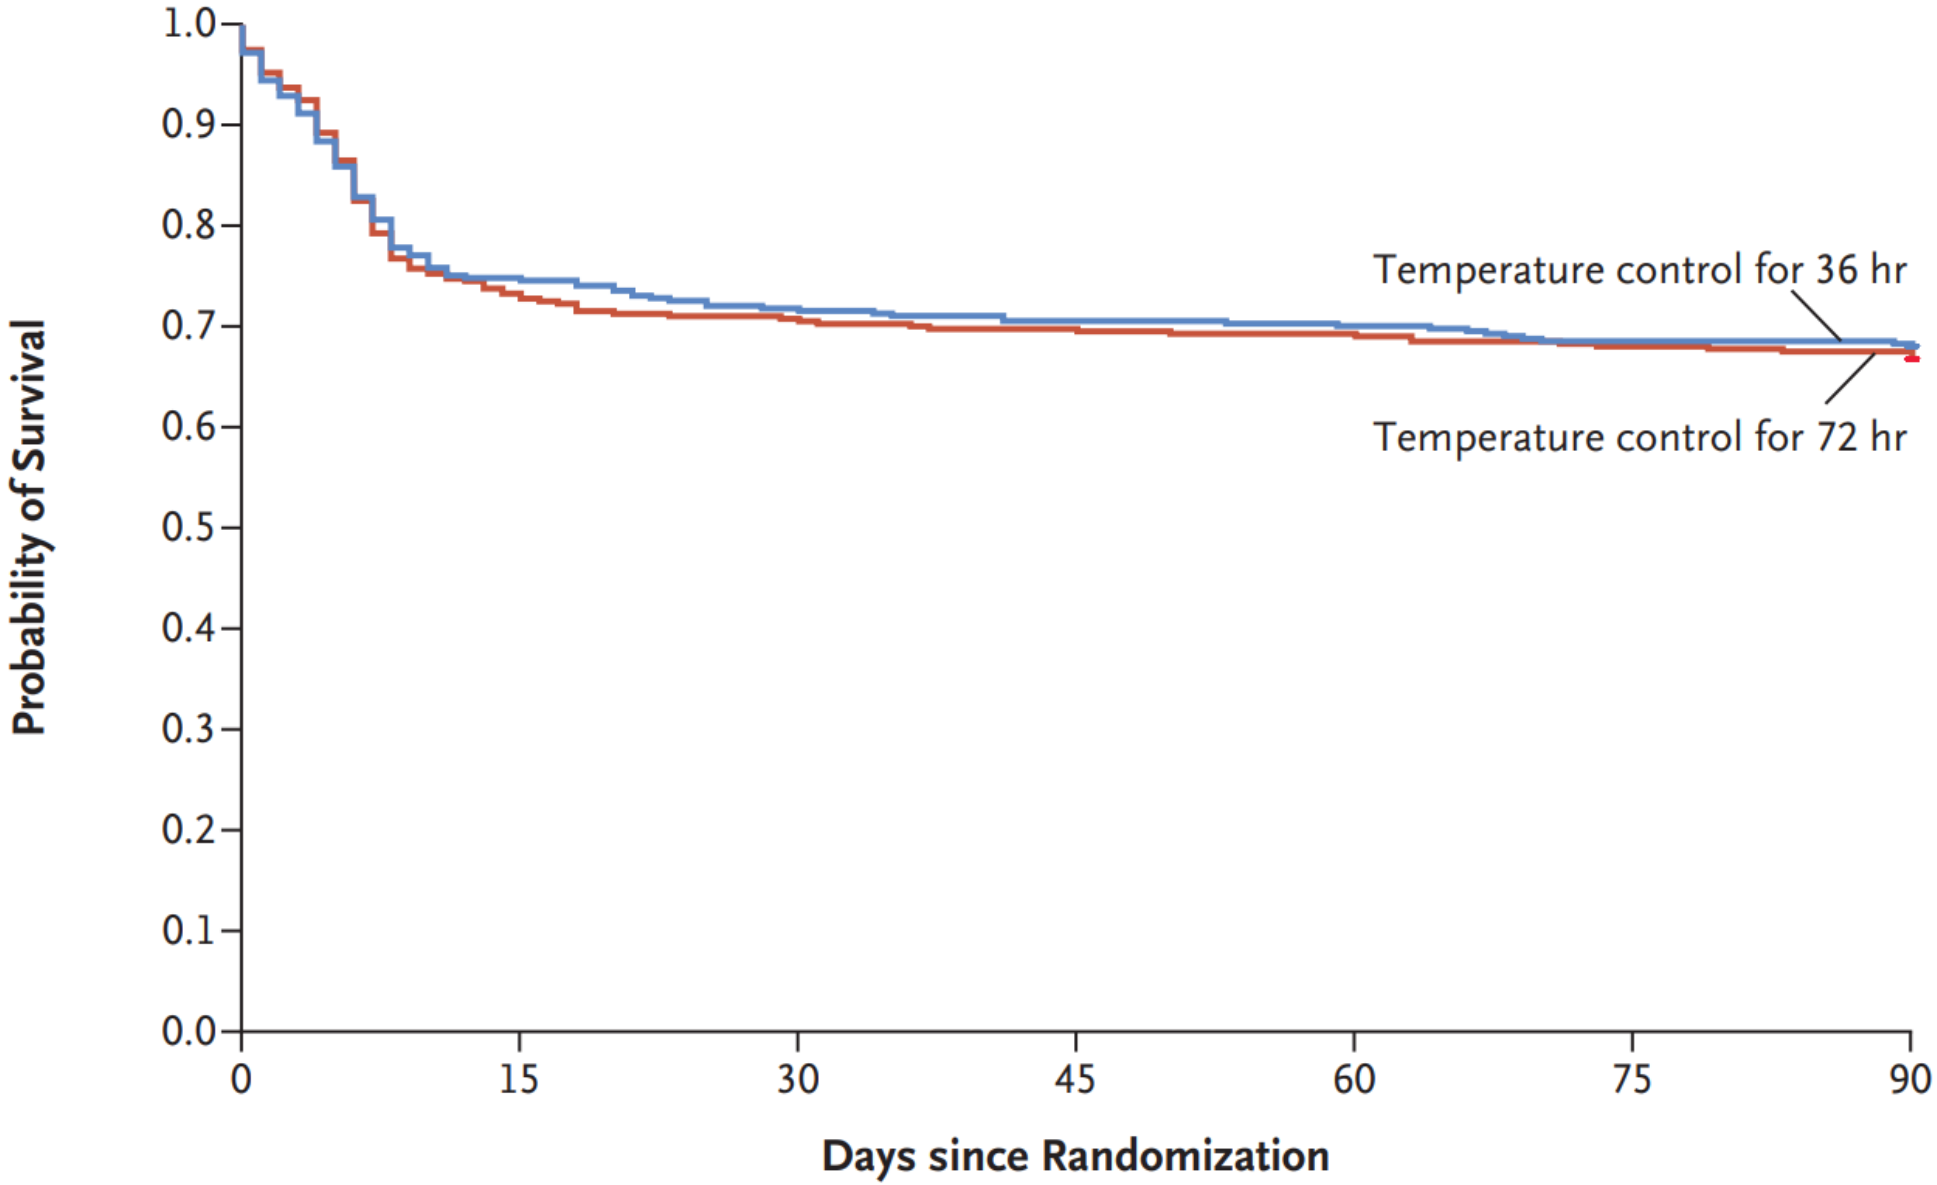
Acute kidney injury with renal-replacement therapy	39 (9.9)	42 (10.6)	0.96 (0.77–1.20)	0.75
Electrolyte disorder††	30 (7.6)	27 (6.8)	1.06 (0.80–1.41)	0.66
Metabolic disorder‡‡	34 (8.7)	28 (7.1)	1.12 (0.84–1.49)	0.41
Seizure§§	84 (21.4)	80 (20.2)	1.04 (0.87–1.24)	0.69



No. at Risk

Temperature control for 36 hr	393	293	281	276	274	268	267
Temperature control for 72 hr	396	289	279	275	273	268	266

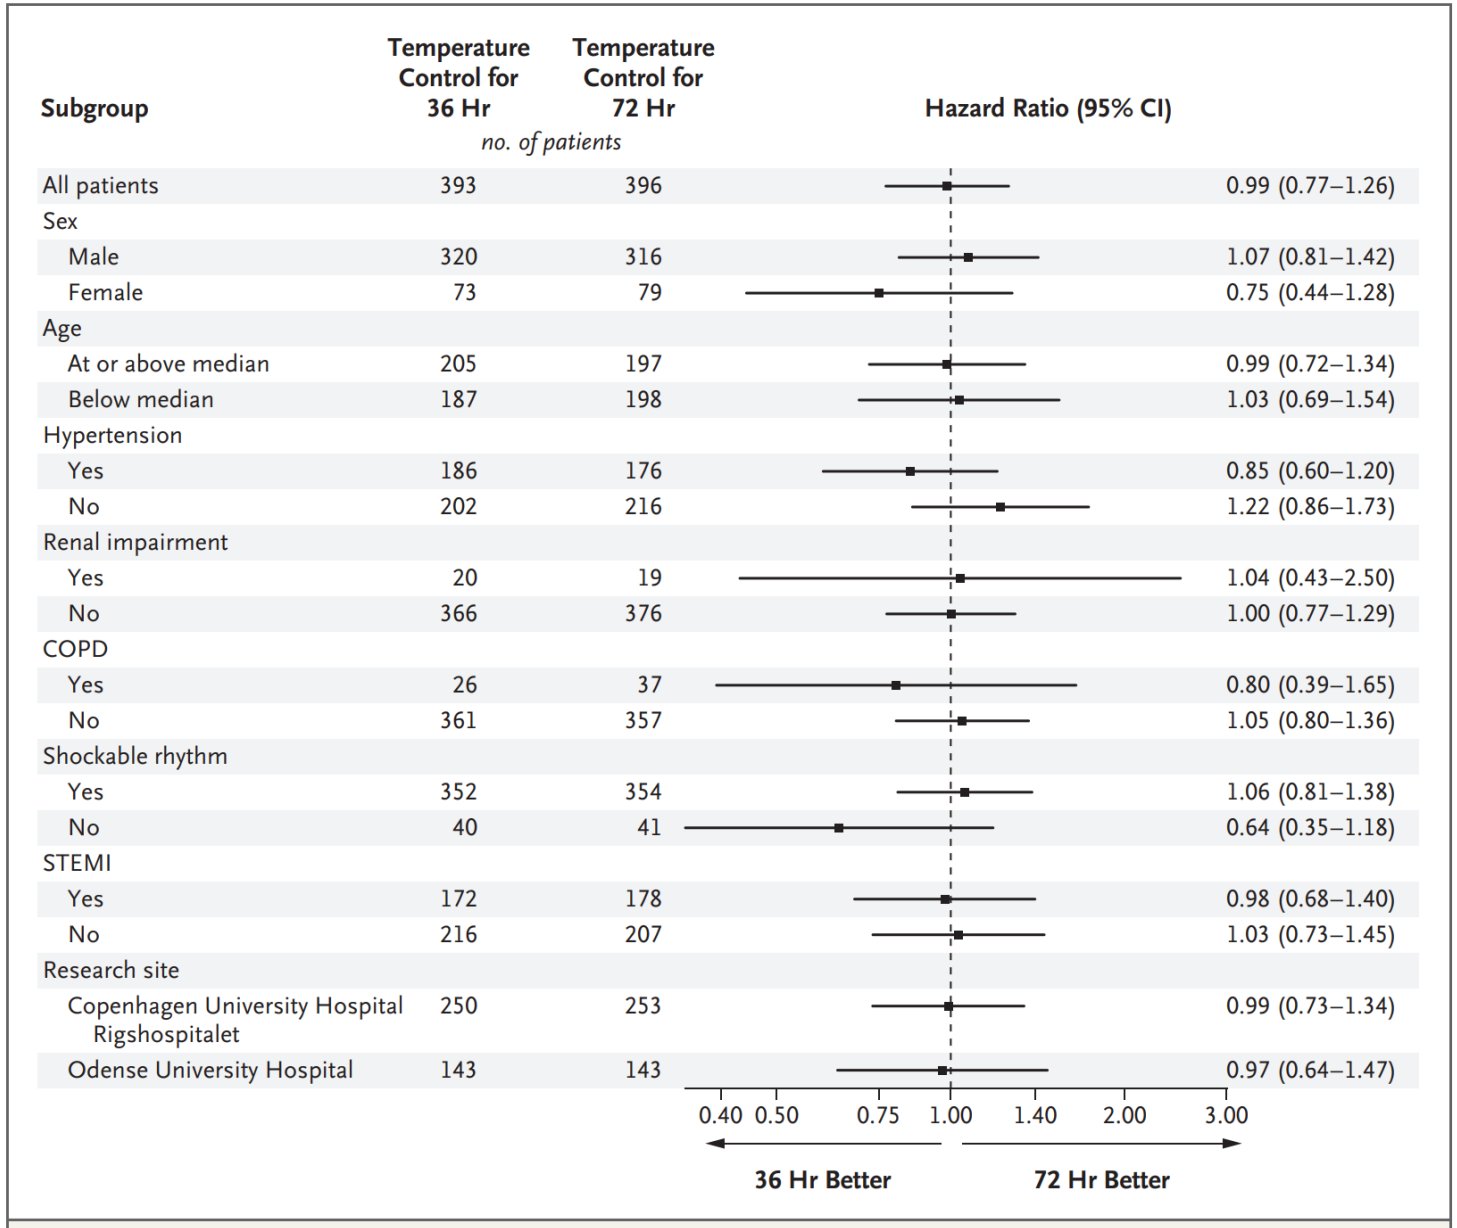


Figure 3. Subgroup Analysis of the Primary Outcome.

Data are from prespecified subgroup analyses of the primary outcome (death from any cause or discharge from hospital with a Cerebral Performance Category of 3 or 4). The forest plot shows the hazard ratios with 95% confidence intervals. COPD denotes chronic obstructive pulmonary disease, and STEMI ST-segment elevation myocardial infarction.

＜Discussion＞

- 介入期間に覚醒した患者（その時点で体温管理は終了）について、いずれかの device-based fever prevention により利があったかどうかについて、調査は行っていない。
- 「36時間」という時間は、冷却-維持-復温という工程が全患者で遂行されるのに必要な時間と考え、設定した。
- 発熱（＞37.7℃）を避けるために antipyretics や uncovering も併用するプロトコルだったが、これらの処置の効果は限定的かもしれず、神経学的不良転帰に対するエビデンスは乏しい。

＜Limitation＞

- 体温介入はマスクされていない。
- 微熱の予防に対しての効果はごく僅か。
- COVID-19 pandemic による制約のため、外来通院の一時停止や、その後も患者が病院へ行くのを避けるなどして追跡が難しくなり、認知機能テストの評価数が想定より少ない。
- 約85%の初期波形が shockable rhythm、約90%がbystander CPR を受けており、本trialでは、比較的良好な予後が期待できる患者が対象。（より重症な脳損傷の集団ではどうか。）
- 統計手法やサンプルサイズが独立したものでなく(先のBOX trial)、わずかな効果に対しては検出力が限られている可能性がある。

＜Conclusion＞

Active device-based fever prevention for 72 hours or 36hours

after cardiac arrest did not result in significantly different

percentages of patients dying or having severe disability or coma.
